WORK EXPERIENCE

Software Developer | TypeScript, React, Node.js, MySQL, AWS, Kubernetes, Java **Jan. 2025 – Apr. 2026**
YuJa Canada Inc. North York, ON

- Engineered a role-based institution management portal using TypeScript, React, and Node.js, consolidating multiple internal portals into a unified platform supporting 200+ higher-education and K-12 clients with per-institution data scoping at the database and API layers
- Delivered an AI-driven proctoring-session summary feature integrating LLMs to turn aggregated flags and metadata into plain-language reports, reducing instructor review time by eliminating manual raw log parsing
- Migrated 100% of product emails (reminders, confirmations, reports) from plain text to interactive HTML, authoring and deploying templates in both the codebase and Amazon SES v2
- Diagnosed and shipped high-priority production hotfixes for client-facing issues, validating changes against the live environment and coordinating across teams under tight timelines
- Refactored the legacy Java access-control service to route domain provisioning through an internal platform API, eliminating direct third-party (GoDaddy) calls to align with company-wide platform standards

EDUCATION

Toronto Metropolitan University **Sep. 2022 – May 2027 (Expected)**
Honours BSc, Computer Science (Co-op) Toronto, ON

- 4.15/4.33 CGPA; Dean's List (2022 – Present); Renewable Scholarship (Highest Level)

PROJECTS

Job Tracker | TypeScript, React, React Router, Node.js, Express, Prisma, PostgreSQL, MUI **Jul. 2026**

- Architected a full-stack job-application tracker with a type-safe REST API, per-user data isolation at the query level, and a shared-types monorepo that enforces contract consistency across the frontend and backend
- Implemented custom session-based authentication using bcrypt, HTTP-only cookies, and server-side Postgres sessions, chosen over JWTs to avoid unnecessary refresh-token rotation since requests already query the database
- Developed a responsive React and MUI frontend featuring a Recharts pipeline-statistics dashboard, deploying the full stack to production across Vercel, Render, and Neon PostgreSQL

AstroLog | Python, Streamlit, Gemini API, Pydantic, SQLAlchemy, PostgreSQL, Cloudflare R2 **Nov. 2026**

- Built an astrophotography session logger with a CLI ingestion pipeline that extracts camera EXIF settings, uploads stripped images to Cloudflare R2, and stores sky/weather data and vector embeddings in PostgreSQL
- Designed a hybrid RAG search pipeline with the Gemini API and pgvector, extracting structured SQL filters from natural-language prompts before ranking by cosine similarity to handle both numeric and semantic search

stashd | Rust **Aug. 2026**

- Constructed a multithreaded, Redis-compatible key-value store in Rust implementing the native RESP wire protocol, with mutex-guarded shared state and crash-safe durability via an atomically compacted write-ahead log

SKILLS

- **Languages**: TypeScript, JavaScript, Python, Java, SQL, C, Rust, HTML, CSS, Bash
- **Frameworks & Libraries**: React, React Native, Node.js, Express, Prisma, SQLAlchemy, Pydantic, Vite, MUI
- **Cloud, Infra & Tools**: Amazon Web Services (AWS), Cloudflare R2 (S3), Docker, Kubernetes, CI/CD, GitHub Actions, PostgreSQL, MySQL, pgvector, Git, Linux
- **Concepts & Practices**: Data Structures & Algorithms, OOP, REST API, Authentication & Authorization (RBAC), Concurrency, Networking, RAG & Vector Search, LLM Integration, Unit & Integration Testing, Agile
