WORK EXPERIENCE

Software Developer | TypeScript, React, Node.js, MySQL, AWS, Kubernetes, Java **Jan. 2025 – Apr. 2026**
YuJa Canada Inc. North York, ON

- Engineered a role-based institution management portal using TypeScript, React, and Node.js to consolidate multiple internal portals into a unified self-service platform used by 200+ higher-education and K-12 clients, with per-institution data scoping at the database and API layers
- Delivered an AI-driven proctoring-session summary feature integrating LLMs to turn aggregated flags and metadata into plain-language reports, reducing instructor review time by eliminating manual raw log parsing
- Migrated 100% of product emails (reminders, confirmations, reports) from plain text to interactive HTML, authoring and deploying templates in both the codebase and Amazon SES v2
- Diagnosed and shipped high-priority hotfixes for client-facing issues, validating changes directly against the live production environment before shipping, and coordinating with cross-functional teams under tight timelines
- Refactored the legacy Java access-control service to route domain provisioning through an internal platform API, eliminating direct third-party (GoDaddy) calls to align with company-wide platform standards

EDUCATION

Toronto Metropolitan University **Sep. 2022 – May 2027 (Expected)**
Honours BSc, Computer Science (Co-op) Toronto, ON

- 4.15/4.33 CGPA; Dean's List (2022 – Present); Renewable Scholarship (Highest Level)

PROJECTS

Job Tracker | TypeScript, React, React Router, Node.js, Express, Prisma, PostgreSQL, MUI **Jul. 2026**

- Architected a full-stack job-application tracker with a type-safe REST API, per-user data isolation at the query level, and a shared-types monorepo that enforces contract consistency across the frontend and backend
- Implemented a custom session-based authentication system (bcrypt + server-side Postgres sessions + secure HTTP-only cookies) deliberately chosen over JWTs for instant revocation
- Developed a responsive React/TypeScript frontend with a Recharts statistics dashboard and deployed the complete stack to production (Vercel frontend + Render backend + Neon PostgreSQL)

stashd | Rust **Aug. 2026**

- Built a Redis-compatible key-value store in Rust that fully implements the native RESP wire protocol, enabling direct use with production redis-cli clients
- Designed a thread-per-connection concurrency model built on mutex-guarded shared state and crash-safe durability via an atomically compacted write-ahead log

resumatch | Python, sentence-transformers, spaCy, KeyBERT, Streamlit, pytest **Aug. 2026**

- Constructed a semantic resume-to-job matching engine using sentence embeddings and cosine similarity, with clause-aware keyword extraction and importance-weighted scoring, tested with pytest and deployed on Streamlit

SKILLS

- **Languages**: TypeScript, JavaScript, Python, Java, SQL, C, Rust, HTML, CSS, Bash
- **Frameworks & Libraries**: React, React Native, React Router, Node.js, Express, Vite, Prisma, Recharts, MUI
- **Cloud, Infra & Tools**: Amazon Web Services (AWS), Docker, Kubernetes, CI/CD, GitHub Actions, PostgreSQL, MySQL, Git, Linux
- **Concepts & Practices**: Data Structures & Algorithms, OOP, REST API, Authentication & Authorization (RBAC), Concurrency/Multithreading, Networking, LLM Integration, Unit & Integration Testing, Agile
